TagAlert

Is there an AirTag following me? I need to know now.

Elizabeth Hadik-Barkoczy | University of Arizona | APCV 498 Capstone | Field-tested November 1 to 9, 2026

The problem An AirTag hidden in a bag or car shows someone else where you are. A tag separated from its owner can wait 8 to 24 hours before it makes a sound. **TagAlert is an iPhone app for that window: open it, and know in minutes whether a tag is moving with you.**

8-24 h
before a separated AirTag makes a sound (MacTech, 2021)

1 Find
Queue every unnamed Bluetooth device, strongest signal first, and connect briefly.

2 Confirm
Ask for one service. An AirTag offers 7DFC9000-7D1C-4951-86AA-8D9728F8D66C.

3 Judge
Low under 1 min. Medium 1 to 2 min, High 2 min or more, both moving with you.

4 Locate
At High, ask once: Find This Tag? Beep Now makes the AirTag sound.

How it sees iOS never passes Apple's Find My data to apps, so TagAlert asks each device directly. Movement comes from the step counter; no location, no signal strength.

10.4 s
Median time to confirm
21 confirmations, 2.9 to 28 s

123 s
To High in the final walk
148 m walked; Medium at 72 s, 77 m

0
Alerts, tags not moving
7 stationary tests, up to 47 min

26 / 27
Beeps accepted, my tags
separated from their owner

Key finding At strong signal, a tag whose owner was nearby refused the beep 3 of 3 times; the same tag beeped with its owner away. It works exactly in the planted-tag case.

Limits Foreground only. iOS hides whether a tag is with its owner. One phone, one home, one route. About 17% battery per hour, screen on.
